

Pitfalls of Shoulder Surfing Studies

Oliver Wiese, Volker Roth Institute of Computer Science Freie Universität Berlin, Germany

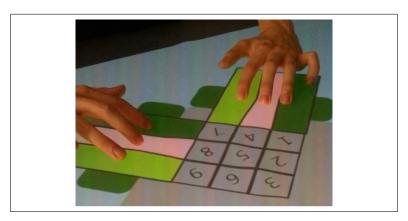

Source: http://www.inthebag.org.uk/wp-content/uploads/2011/12/Shoulder-surfing-MO.jpg

Goals of the adversary:

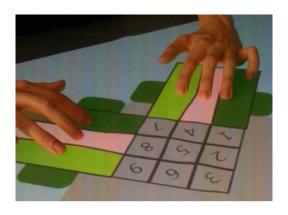

- Observe an authentication session.
- Authenticate as the user.

User authentication with PressureGrid

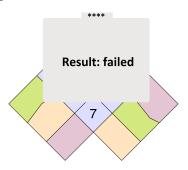

User authentication with PressureGrid

Adversary inputs a guess:

Reasons of failure:

- ▶ Guessed the wrong number.
- ▶ Inputed the wrong number.

... can lead to an under-estimation of risk.

We shall ...

- ... verify adversaries report what they intend to report.
- ... measure the success without input errors.

One authentication session of four digit pin:

Guess of adversary:

X	2	3
4	5	6
7	8	9

1	2	3
4	×	6
7	8	9

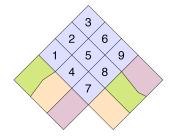

1	2	3	
4	5	6	
7	8	9	

X	2	3
4	5	6
7	8	9

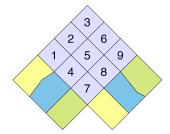

- Flickering lights
- ▶ Minimizing the finger movement
- ▶ The distance between hands
- ► Two dimension input

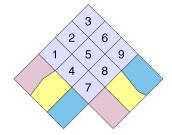

- Flickering lights
- ▶ Minimizing the finger movement
- ▶ The distance between hands
- ► Two dimension input

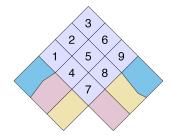

- Flickering lights
- Minimizing the finger movement
- ▶ The distance between hands
- ► Two dimension input

Isolating the Source of Security

- Flickering lights
- ▶ Minimizing the finger movement
- ▶ The distance between hands
- ► Two dimension input

Kim et al. studied them jointly.

Which elements have a high impact for the security? Which marginally?

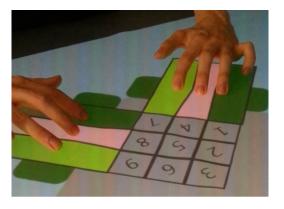

We shall ...

... isolate the core contributors in an empirical study.

Simulation of the Adversary: Strategies

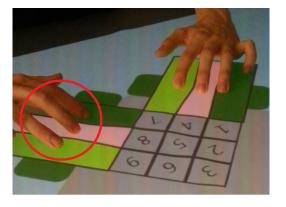

PressurePIN:

▶ 2 of 14 adversaries broke PressurePIN.

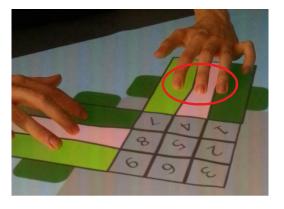

First observation:

▶ 2 of 14 adversaries broke PressurePIN.

Second observation:

▶ 2 of 14 adversaries broke PressurePIN.

Simulation of the Adversary: Strategies

- Participants may not find or use strategies.
- Real adversaries find, learn and use strategies.
- Can lead to an under-estimation of risk.

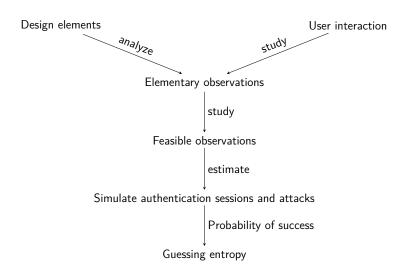

We shall . . .

... take observation strategies into account in an empirical study.

Outlook: An Approach to handle Strategies

Summary

We talked about:

- Input methods and input errors of the adversary
- Isolating the source of security
- Strategies in studies

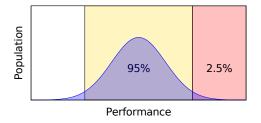

More in our paper about:

- ► Side-Channels due to user behavior
- The adversary
- **>** . . .

Conclusion

- Study design and report is important.
- Studying security is different from usability.

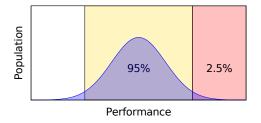

In security we are also interested beyond the mean.

Conclusion

- ▶ Study design and report is important.
- Studying security is different from usability.

In security we are also interested beyond the mean.

Future work: Finding new ways of security analysis

Thank you for your attention!

What are your experience with security and usability studies?
