

Exploring Design Directions for Wearable Privacy

Katharina Krombholz*, Adrian Dabrowski*, Matthew Smith**, Edgar
Weippl*

USEC Mini Conference 2017

How can privacy preferences be
communicated towards
(wearable) cameras?

... in situations where people are
constrained in what they can
carry or wear?

Existing approaches

- No mass-market solution available
- Approaches from related literature
 - not applicable in such a scenario
 - intrusive
 - do not meet the context-dependent nature

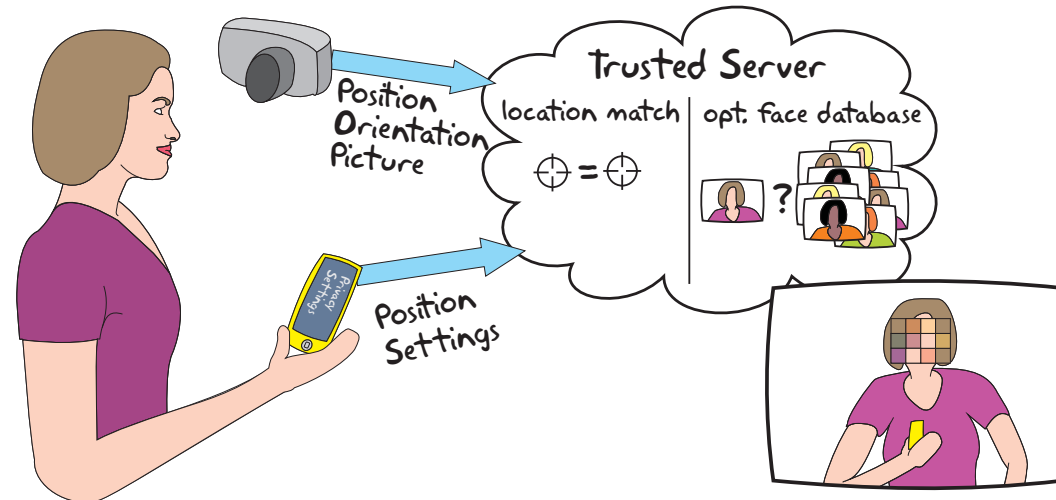

Methodology

- Define 3 conceptual (“meta-”) PETs from related work
- Conduct qualitative interviews in the public places
 - Beach
 - Café
- Google Glass served as example technology to provoke participant reactions

Conceptual PETs

Privacy App

- based on SnapMe [1], and Faceblock [2]
- Uploads pictures to a centralized service
- Individuals on pictures are identified via co-location and (optional) face recognition

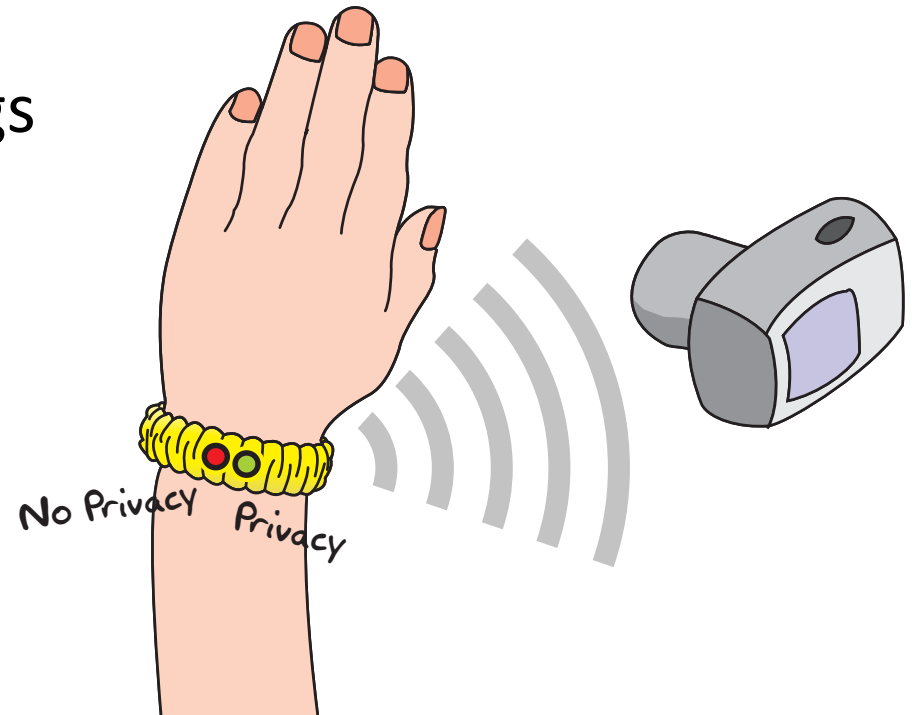

Privacy Fabric

- based on *Respectful Cameras* [3] and P3F [4]
- Fabric patterns to encode privacy policies
- Pattern recognition
- No digital artifact required

Privacy Bracelet

- half-way point between app and fabric
- served as middle ground during interviews to contrast between the other two
- bracelet with a button
- emits signal to cameras in the surroundings

User Study

User Study

- Field sessions (beach/café)
- Qualitative semi-structured interviews
- 20 participants
 - 9 male, 11 female
 - age: 19-42, median: 25
 - no participant was working in an IT-related field!

Results

Technology Familiarity

- Everyone had a rough idea of Google Glass
- 17 participants immediately associated a camera with the device

REC

Privacy Considerations

- Discomfort and irritation(12)
- Am I being recorded? (11)
- Vexation, concerned about mass surveillance (6)

“If someone wore it [Google Glass] in front of me, I’d definitely ask him to take it off.” (P13)

Privacy Considerations

- neutral feeling, have gotten used to cameras, but context is important (8)

“In general, I don’t really care about privacy. But I would not want to be filmed drinking during a party.” (P17)

“[...]. Maybe Glass performs face recognition in the background and transmits the information about the recorded people to the NSA. This would make every Glass-wearer an unintended little helper of the NSA.” (P19)

PETs Preferences

Privacy App	Privacy Fabric	Privacy Bracelet
4	2	13
2€	Common clothing price	10-200€

→ No trend differences (beach/cafe)!

PETs Preferences (and Concerns)

- Bracelet

- Ease of use, convenience, visibility
- Does not require smartphone, OSN

- App

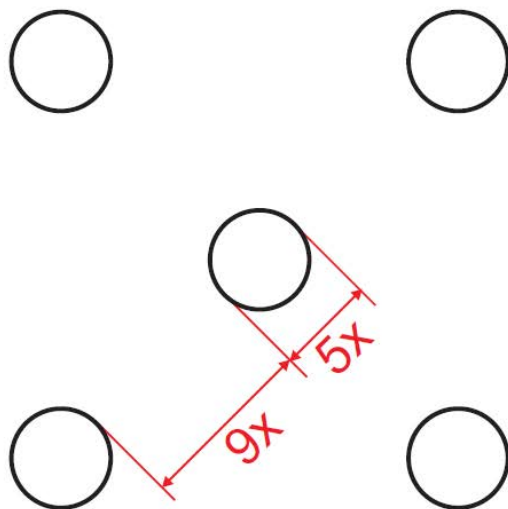

“The server behind the app bothers me just as much [...].” (P15)

- Fabric

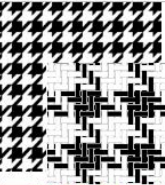

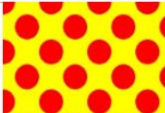

- Personal styling preferences
- Difficult to adjust to the context
- Little understanding of how this could work

Discussion

P3F.at

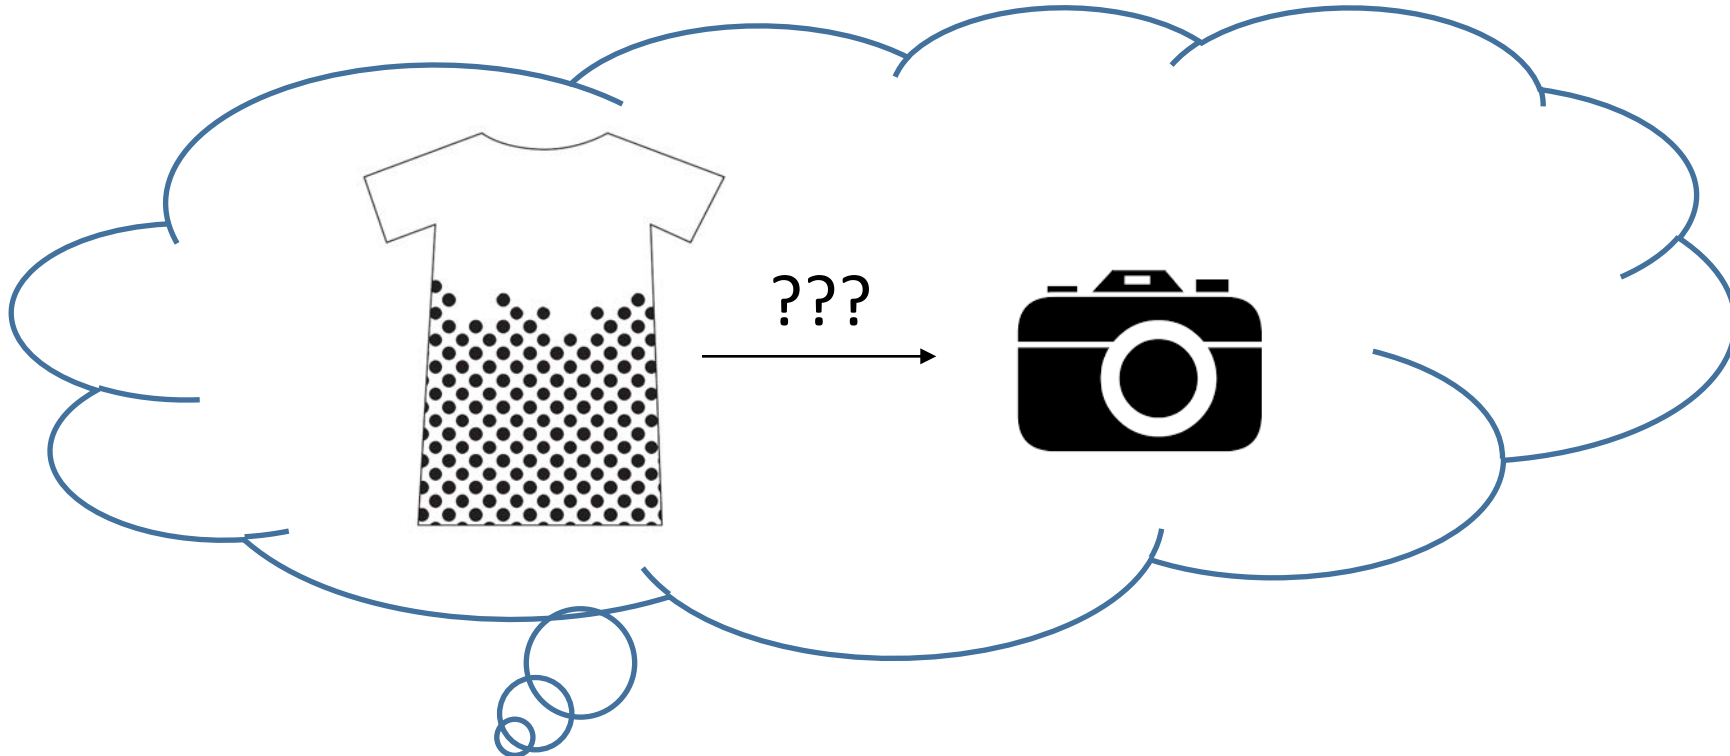

P3F.at

Beispiel	Name	Produktionsart	Muster-Encoding	Watermarking
	Argyle Burlington-Karo	gewebt	Farben: zerstört Geometrie Streifendicke: stört Geometrie erheblich	
	Border Tartan (Shepherds' Plaid, Border check, Border Drab, and Northumbrian tartan)	gewebt	Farben: oft nur zweifärbig Dicke: zerstört Geometrie	
	Check, Chequer, Vichy, Gingham	gewebt	Farben: oft nur zweifärbig Dicke: zerstört Geometrie	
	Plaid ('Plaid'), Tartan	gewebt	Farben: viele Mischfarben entstehen – passende Farbtupel sind schwer automatisch zu generieren. Dicke: zerstört in vielen Fällen die Geometrie	
	Camouflage	print	Wesen des Musters ist es, Gleichmäßigkeiten zu zerstören. Damit ist die Kodierung (Delta zwischen Gleichmäßig und Ungleichmäßig) besonders schwierig	Watermarking schwierig
	herringbone Fischgrät, Chevron	gewebt		Supergleichmäßig – lebt davon
	Chevron (manchmal ebenfalls Fischgrät, Herringbone)	gedruckt		Fabkodierung evtl möglich, Strichdicke: evtl möglich Kodierungstechnisch eine Untermenge der Streifenmuster, da aus dem Grätmuster selbst keine Kodierung zu bauen ist.
	Houndstooth Hahnentritt	gewebt, gestrickt		Geometrisch kaum veränderbares Muster
	Paisley Persian pickles, Welsh pears, mango seeds, cypress tree	gewebt, print, gestickt		sehr kleinteilig, geringe Gleichförmigkeit Mögliches Ziel für Watermarking
	Toile de Jouy Toile	print		Kaum Wiederholungen oder Gleichmäßigkeiten, Synchronisationsproblem Mögliches Ziel für Watermarking
	Polka Dots Mizu Tama, Polka Sehr viele Varianten!	Print, (gewebt)		Variante Reichum (Punktgröße, Farben) erleichtert das Kodieren, wobei Punkteabstände nur auf flachen Gegenständen funktionieren und eigentlich das Wesen des Musters zerstören.

P3F.at

- Technically feasible (we implemented a matlab prototype)
- BUT: users do not understand how the communication between the camera and the fabric works and therefore have little trust.

Photographer vs. Bystander

- Participants were allowed to try the device
- ... and they liked it.
- Privacy concerns vanished!

Feasibility Considerations

- “Recht am eigenen Bild” → Right of persons to their own image representation
- Legal foundation
- Robots.txt

Beyond visual recording

- Smart environments, smart home, industry 4.0
- Sensors are everywhere!!

Take-Home Message

- PETs should work regardless of a specific location (beach is a challenging environment!)
- Sense of control: a simple button to push
- Technical feasibility vs. user acceptance
