# Overlay: Output Manipulation

Remote device

Insulin (U)	<input type="text" value="177"/>
Heart rate	<input type="text" value="75"/>
Basal rate (U/Hr)	<input type="text" value="0.025"/>
Low limit (mg/cc)	<input type="text" value="6000"/>
High limit (mg/cc)	<input type="text" value="10500"/>

## Observation 2

If the *protected output* is provided *out-of-context*,  
users are more likely not to verify it.  
Therefore input integrity can be violated.

# Overlay: Early Form Submission Attack

- Fidelius
- Trusted overlay from FPGA

## Observation 3

If *not all the modalities of inputs* are secured simultaneously, none of them can be fully secured.

# Requirements

The lack of output integrity – *the render of user inputs on the screen* – compromises input integrity.

**Inter-dependency between Input and output**

# Requirements

If *not all the modalities of inputs* are secured simultaneously, none of them can be fully secured.

**All modalities of input**

# Requirements

If the *protected output* is provided *out-of-context*, users are more likely not to verify it.  
Therefore input integrity can be violated.

## Low cognitive load

# Requirements

**Low TCB and easy deploy**

# Requirements

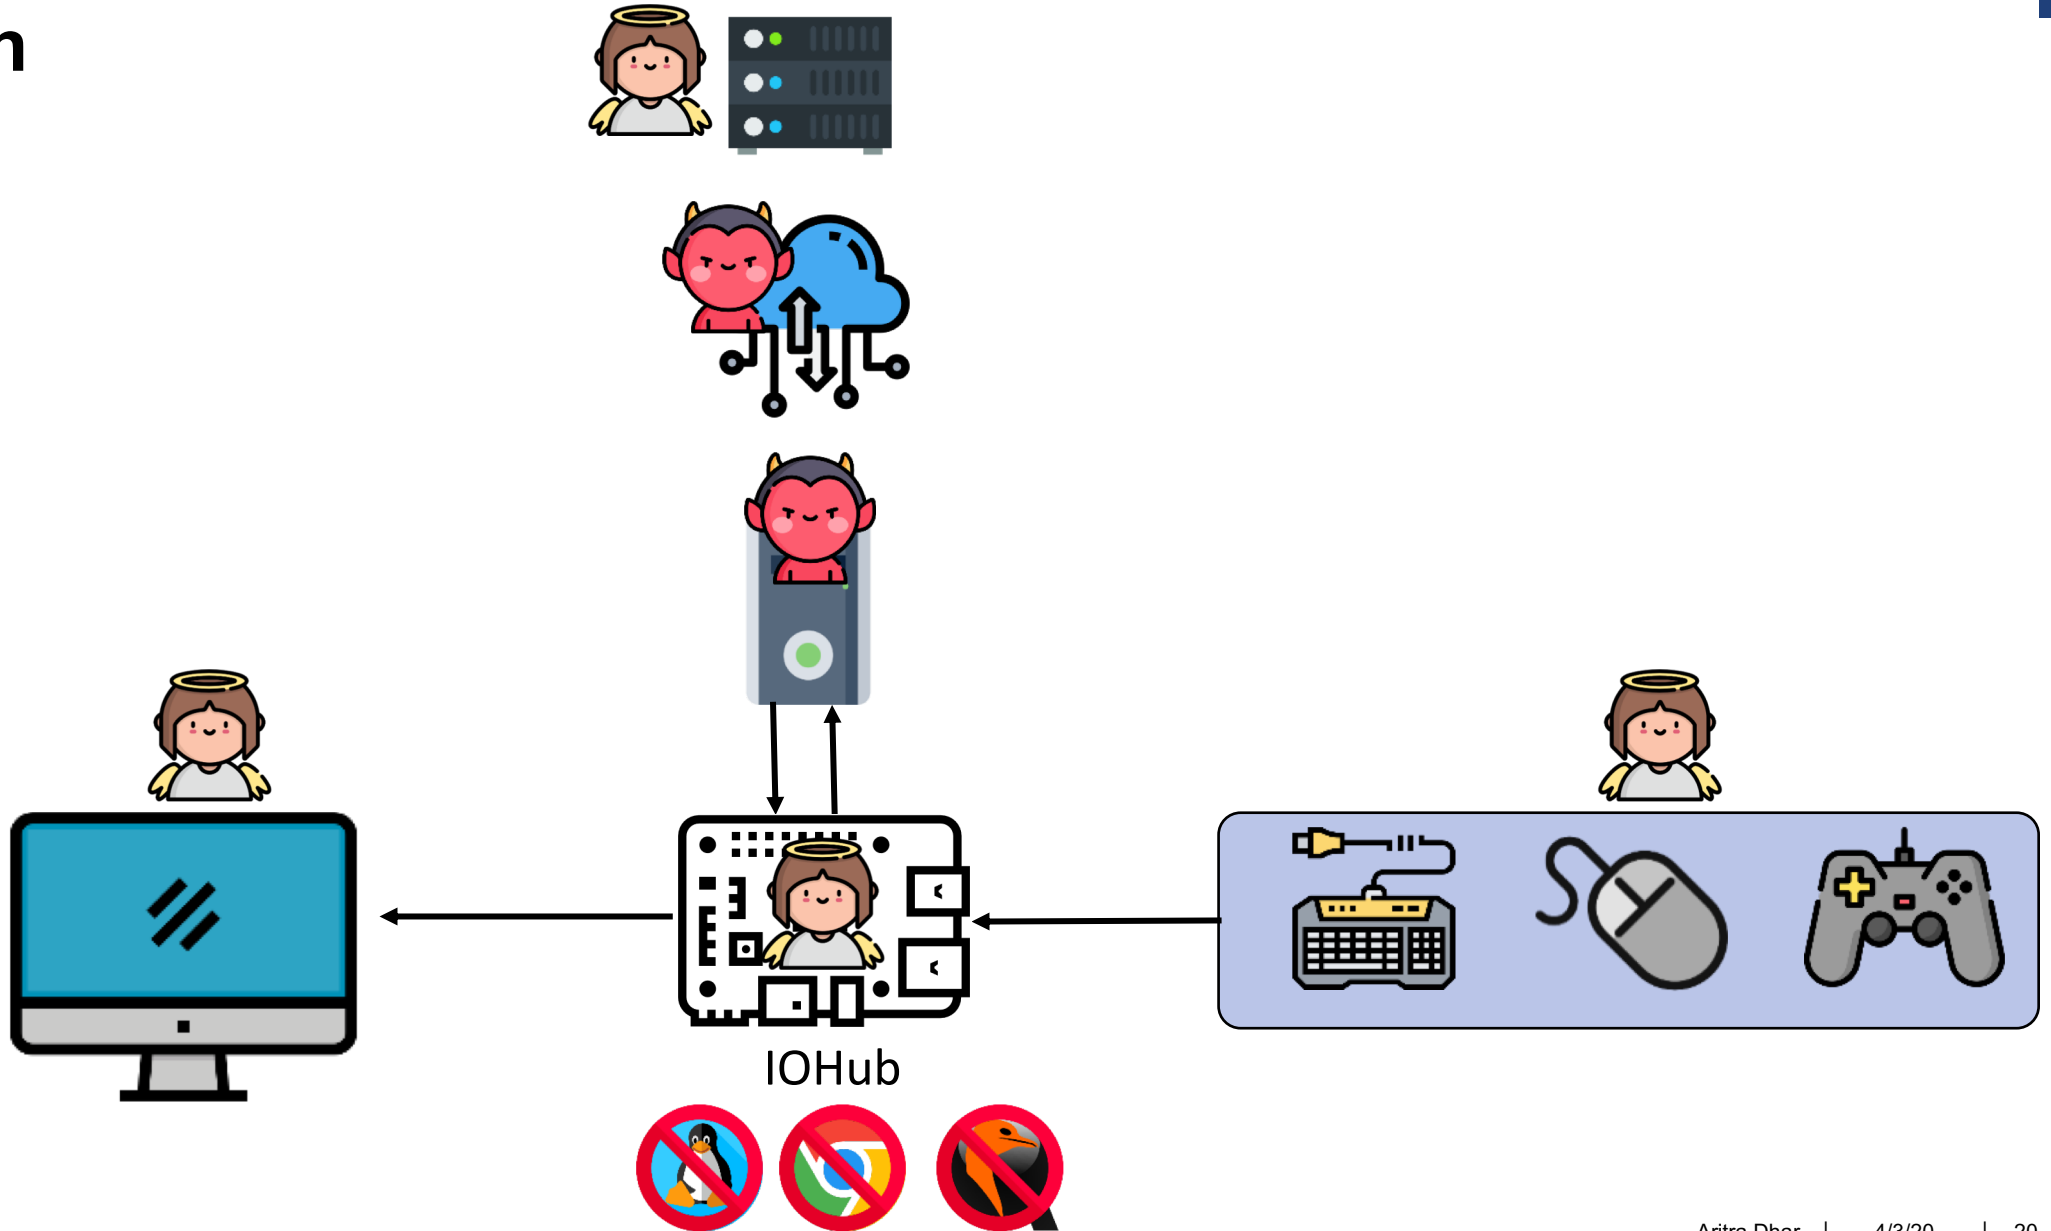

# ProtectiOn

Low TCB + fast deployment

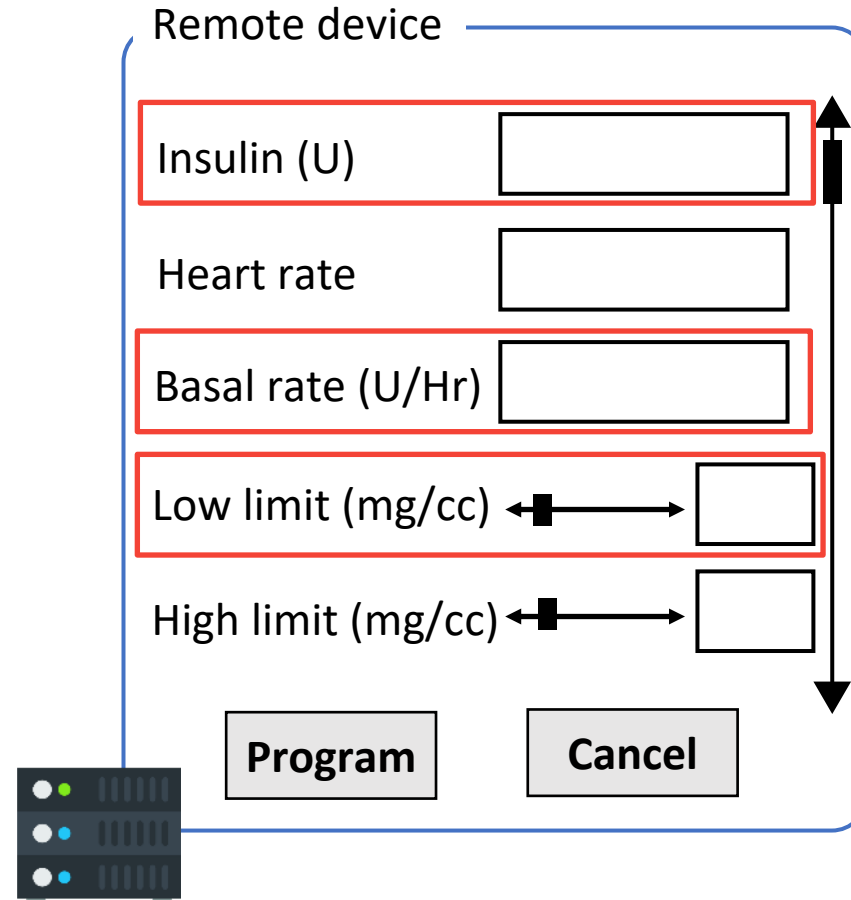

Input modalities

# How to Build a Trusted Path

- Server sends messages : HTML, JS ...  $\rightarrow m$
- All modalities of inputs  $\rightarrow I$ 
  - $Input( ) \rightarrow [m] \rightarrow I$
- Host transforms them : Browser, GPU ...  $+ I \rightarrow [m]$ 
  - $Transform( ): m, I \rightarrow [m]$
- Host is a bad guy  $\rightarrow [m] \text{ or } [m']$
- Output integrity  $\rightarrow$  Users need to report back  $[m] / [m']$

## Definition: Violation of Input/output Integrity

- Server sends  $m$
- Server knows  $[m]$
- Given  $[m]$ , correct input is  $I$
- Host sends  $[m'] \neq [m]$  **Output integrity**
- User sends  $I' \neq I$  **Input integrity**

# Verification

Anything missing in the chain  $\rightarrow$  IO integrity violation

# Overlay: Output Manipulation

Remote device

Insulin (U)	177
Heart rate	75
Basal rate (U/Hr)	0.025
Low limit (mg/cc)	6000
High limit (mg/cc)	10500

Program Cancel

The form is enclosed in a blue rounded rectangle. A vertical double-headed arrow on the right side of the rectangle indicates the range of the insulin, heart rate, and basal rate values. The low and high limit values are shown with horizontal double-headed arrows pointing to their respective input boxes.
